Keymacro is a nifty utility that will help you generate any supported code sequence, containing custom keystrokes, buttons or macros. The software is divided into a series of modules, each of which is capable of adding a new action to the input or output areas of the operating system. In other words, you can easily perform all kinds of functions, such as opening a specific document, running a shell script, and executing an instruction string. The idea of Keymacro is simple enough: you can easily trigger any action you want on your computer by typing in the appropriate codes. What is more, you will be able to create your own macros, which is a big advantage since you won't be limited to the predefined actions available with the program. Custom keyboards First of all, the default built-in keyboard is fully customizable, allowing you to add new entries and rearrange the layout of the existing buttons. Up to four different keyboards can be installed at once, and their positions can be moved at will. They can be dragged to the desired location and then dropped. Furthermore, you can use the Insert Keys function to add any entry to the keyboards. Macro sequence For users who don't want to make new keyboards, there is an option to define a macro. All you have to do is to type in the name of the macro, add the keystrokes you want to use, and then add the instructions string. All macros will be recorded in the file you specified when you first installed the application. Where it falls short Since Keymacro's functionalities are limited to the input and output areas of the operating system, you will have to use the external software mentioned in the program's reviews for converting the input and output sequences to usable actions. Moreover, Keymacro doesn't offer you the option to load the macro from a file, check its syntax, or rearrange the already-defined macros. On the downside, the application has a limited collection of predefined macros (as well as a number of different input and output areas) that you can't select or move. Performance All the

macros created with Keymacro can be used at the same time without any performance loss. Bottom line If you are looking for a simple tool that will help you create macros or sequences of custom keystrokes, Keymacro is a great choice. AppleScript Description: AppleScript is a 1d6a3396d6
