Tired I am, but yet I have a nice evening ahead of me with my family and the excitement of getting to swim in the pool with the little fellas after the Thanksgiving meal.... I went to bed a few hours ago... got up at 5:30 am.. - this is so against the rules, but I had a really bad night, and then some. I've been having constipation problems for about a month now, and yesterday morning I had some sort of difuculty squeezing poo that would not exit through my anus. So I strained and strained and strained, and yet the foley poo constipation refused to produce. Something was telling me that I would not be able to contain my poo... er.. I said the word.. " foley poo" if you don't know what that is,

For the best quality in sound, use the vc audio bundle. for mac..1. Technical Field The present invention relates to managing the loading and unloading of air-flight baggage. More particularly, the invention relates to systems, processes, and tools for providing luggage loading and unloading in airports. 2. Description of the Related Art Airport security is among the top issues of the U.S. Transportation Security Administration (TSA). Because of varying passenger behavior, airports need to improve their security. A recent poll showed that one of the most reported security lapses is baggage smuggling. Every year tens of thousands of bags are smuggled through airports. In many cases, smuggled bags are easier to smuggle because they are heavier and bulkier than standard bags. Smuggling is expensive to the airlines and airport. Smuggled bags cost airlines an average of $300-350 for every bag passing through airport security. Airport security also costs an airport money and time. The TSA estimates that airports spend $4.4 billion every year on security. The TSA has proposed "mark-soak technology," which, uses radar to detect anomalies. Unfortunately, the proposed system has been criticized as ineffective and "all but useless" to detect any subtle objects concealed in the bags. Further, it can only detect abnormally shaped bags. Another issue concerns luggage size. The maximum size for carry-on baggage is one cubic foot. But many sizes of luggage are available. For example, laptop computer bags are available as "trunks" that are the size of a suitcase. This practice is unsafe and unsanitary. A laptop computer, especially a netbook computer, can be dangerous or even deadly, and the laptop could spill liquid, food, or other contents and or get damaged. The TSA also has proposed a "proprietary" luggage detection system. There are many technological issues, however, with detecting a bag with a proprietary system. For example, the bags could be hidden inside the bag making it hard for the detector. Further, after detecting a bag, the detector could "jam," possibly causing damage to the bags. There is a need in the art to overcome problems with security and safety in airports. In particular, there is a need for security systems that make air travel safer.Imaging devices such as printers, fax machines and multi-function devices are often used in rooms such as offices and homes to print information such 648931e174
