What Is Photoshop Adobe Photoshop is a graphics image editing software that is widely used for digitally manipulating raster images. It supports masking and editing of individual layers, the ability to combine images into new files, and a wide range of image-editing tools such as perspective control, cropping, texturing, and conversion to bitmap and other formats. Photoshop usually requires a version of the Adobe Creative Suite, which includes Photoshop as well as a wide range of other applications, such as InDesign, Acrobat Professional, Illustrator, and many others. Photoshop itself was originally launched in 1987. Photoshop is installed on many different computers around the world to edit images, but the applications that come with a version of the Creative Suite are typically the only ones that are used to create art and websites. Photoshop was named after the German-American photolithographer Fritz Kahn. It was first created in 1982 by Adobe's Toni Valtonen and Steve Harrington. How Adobe PhotoShop Came to Be: The Birth of Photoshop Fritz Kahn was a German print and TV photographer who specialized in medical and scientific photography. He was invited to the Adobe Creative Suite in the early 1980s to demonstrate the latest techniques in medical imaging. Their impression of how to solve some of the problems they faced was to create a new program based on the simple idea of the photographic negative, combined with a touch of Gestalt psychology. The idea came to fruition when Kahn's technical advisor, Steve Harrington, called on some of his colleagues to create a new sort of photographic editing program. We used film-editing techniques that were most familiar to the average user. We aimed to make it fast and easy to work with the programs that they were already using to make the postcard-sized images that were their bread and butter. After the program was completed in less than six months, Steve's close associate Toni Valtonen asked him if it were possible to "top it" and make something even better. That is how Photoshop was born, and it ended up being the start of an industry. Structure of Photoshop Adobe Photoshop offers two interfaces for users, depending on what version of the software one has purchased. Although the program structure is largely the same in the current version 18, new features have been added since the introduction of Photoshop in 1987. This version also includes an Adobe Stock library for free or downloadable

Q: Django: How to use a variable in 'with' I'm trying to fetch data from related models so I can use it to make a form. The form would be created within the constructor of the view. I'm getting an error: NoReverseMatch at /get_products/1/ The model Products is a django.db.models.base.Model and the error indicates that a queryset was not given to with() method. View def get_products(request, pk): products = get_object_or_404(Products, pk=pk) return render(request, 'products.html', {'product': products}) Template {% for a in product.category.categories %} {{ a.name }} {% endfor %} {% for b in product.category.categories %} {{ b.name }} {% endfor %} {% for c in product.category.categories %} {{ c.name }} {% endfor %} I have tried to use an 'if' statement in the template, but i was unsuccessful. Is there any way to use variables in the with() method? I have looked at this, this, and this, but nothing helped. I'm still a beginner. A: It's hard to say without the full context. It seems like your view is a bit short to be useful. Why not just be done in the view with something like {{ product.category_set.all()|map:product.id }} That won't return a ModelForm, but it'll give you a list of all related products in one big query. Or... for even better performance, do this: {{ product.category_set.all|dict:(pk|id) }} And this will do the same thing... {{ product.category_set.all|dict:product.id }} We don't expect you to know everything there is to know about programming in C, but we do expect you to have a bit of basic programming knowledge to get by.
